On the exponential Diophantine equation

\[(19^{2m}) + (12\gamma + 1)^n = \rho^2\]

Abstract: The family of Diophantine equations is divided into two categories (linear Diophantine equations and non-linear Diophantine equations). Diophantine equations are very useful for determining the solutions of many puzzle problems. In the present paper, authors studied the exponential Diophantine equation \((19^{2m}) + (12\gamma + 1)^n = \rho^2\), where \(m, n, \gamma, \rho\) are whole numbers, for determining its solution in whole number. Results show that the exponential Diophantine equation \((19^{2m}) + (12\gamma + 1)^n = \rho^2\), where \(m, n, \gamma, \rho\) are whole numbers, has no solution in whole number.

Keywords: Exponential Diophantine equation; Congruence; Modulo system; Numbers.

Mathematics Subject Classification: 11D61, 11D72, 11D45.

I. INTRODUCTION

Diophantine equations have many applications in the different field of mathematics such as coordinate geometry, cryptography, trigonometry and applied algebra. There is no generalizing method for solving all Diophantine equations. So, the problem of finding the solutions of Diophantine equations has very much attention by the scholars. Aggarwal et al. [1] discussed the Diophantine equation \(223^x + 241^y = z^2\) for solution. Existence of solution of Diophantine equation \(181^x + 199^y = z^2\) was given by Aggarwal et al. [2]. Bhatnagar and Aggarwal [3] proved that the exponential Diophantine equation \(421^m + 439^m = r^2\) has no solution in whole number.

Gupta and Kumar [4] gave the solutions of exponential Diophantine equation \([n^r + (n + 3m)^y = z^k]\). Kumar et al. [5] studied exponential Diophantine equation \(601^p + 619^q = r^2\) and proved that this equation has no solution in whole number. The non-linear Diophantine equations \(61^x + 67^y = z^2\) and \(67^x + 73^y = z^2\) are studied by Kumar et al. [6]. They determined that the equations \(61^x + 67^y = z^2\) and \(67^x + 73^y = z^2\) are not solvable in non-negative integers. Kumar et al. [7] examined the non-linear Diophantine equations \(31^x + 41^y = z^2\) and \(61^x + 71^y = z^2\). They proved that the equations \(31^x + 41^y = z^2\) and \(61^x + 71^y = z^2\) are not solvable in whole numbers. Mishra et al. [8] gave the existence of solution of Diophantine equation \(211^a + 229^b = y^2\) and proved that the Diophantine equation \(211^a + 229^b = y^2\) has no solution in whole number.

Diophantine equations help us for finding the integer solution of famous Pythagoras theorem and Pell’s equation [9-10]. Sroysang [11, 14] studied the Diophantine equations \(8^x + 19^y = z^2\) and \(8^x + 13^y = z^2\). He determined that \(x = 1, y = 0, z = 3\) is the unique solution of the equations \(8^x + 19^y = z^2\) and \(8^x + 13^y = z^2\). Sroysang [12] studied the Diophantine equation \(31^x + 32^y = z^2\) and determined that it has no positive integer solution. Sroysang [13] discussed the Diophantine equation \(3^x + 5^y = z^2\). Goel et al. [15] discussed the exponential Diophantine equation \(M_5^p + M_7^q = r^2\) and proved that this equation has no solution in whole number.

Kumar et al. [16] proved that the exponential Diophantine equation \((2m+1 - 1) + (6r+1 + 1)^n = \omega^2\) has no solution in whole number. The exponential Diophantine equation \((7^{2m}) + (6r + 1)^n = z^2\) has studied by Kumar et al. [17]. Aggarwal and Sharma [18] studied the non-linear Diophantine equation \(379^x + 397^y = z^2\) and proved that this equation has no solution in whole number. Aggarwal and others [19-21] studied the Diophantine equations \(193^x + 211^y = z^2, 313^x + 331^y = z^2\) and \(331^x + 349^y = z^2\). They proved that these equations have no solution in whole number.

The main object of the present paper is to determine the solution of exponential Diophantine equation \((19^{2m}) + (12\gamma + 1)^n = \rho^2\), where \(m, n, \gamma, \rho\) are whole numbers, in whole numbers.

Preliminaries:

Lemma: 1 The exponential Diophantine equation \((19^{2m}) + 1 = \rho^2\), where \(m, \rho\) are the whole numbers, is not solvable in whole number.

Proof: Since \((19^{2m})\) is an odd number for all whole number \(m\).

\[\Rightarrow (19^{2m}) + 1 = \rho^2\] is an even number for all whole number \(m\).

\[\Rightarrow \rho\] is an even number.

\[\Rightarrow \rho^2 \equiv 0(\bmod{3})\ or \ \rho^2 \equiv 1(\bmod{3}) \quad (1)\]

Now, \(19 \equiv 1(\bmod{3})\,\, for\,\, all\,\, whole\,\, number\,\, m\).

\[\Rightarrow (19^{2m}) \equiv 1(\bmod{3})\,\, for\,\, all\,\, whole\,\, number\,\, m.\]
⇒ (19 m) + 1 ≡ 2 (mod 3), for all whole number m.
⇒ ρ^2 ≡ 2 (mod 3) (2)

The result of equation (2) denies the result of equation (1).

Hence the exponential Diophantine equation (192m) + 1 = ρ^2, where m, ρ are the whole numbers, is not solvable in whole number.

**Lemma:** 2 The exponential Diophantine equation 1 + (12γ + 1)^n = ρ^2, where γ, n, ρ are whole numbers, is not solvable in whole number.

**Proof:** Since (12γ + 1) is an odd number for all whole number γ so (12γ + 1)^n is an odd number for all whole numbers γ and n.

⇒ 1 + (12γ + 1)^n = ρ^2 is an even number for all whole numbers γ and n.
⇒ ρ is an even number
⇒ ρ^2 ≡ 0 (mod 3) or ρ^2 ≡ 1 (mod 3) (3)

Now (12γ + 1) ≡ 1 (mod 3), for all whole number γ
⇒ (12γ + 1)^n ≡ 1 (mod 3), for all whole numbers γ and n
⇒ 1 + (12γ + 1)^n ≡ 2 (mod 3), for all whole numbers γ and n.
⇒ ρ^2 ≡ 2 (mod 3) (4)

The result of equation (4) denies the result of equation (3).

Hence the exponential Diophantine equation 1 + (12γ + 1)^n = ρ^2, where γ, n, ρ are whole numbers, is not solvable in whole number.

### II. MAIN THEOREM

The exponential Diophantine equation (13^2m) + (12γ + 1)^n = ρ^2, where m, n, γ, ρ are whole numbers, is not solvable in whole number.

**Proof:** The complete proof of this theorem has four parts.

**Part:** 1 If m = 0 then the exponential Diophantine equation (192m) + (12γ + 1)^n = ρ^2 becomes 1 + (12γ + 1)^n = ρ^2, which is not solvable in whole numbers according to lemma 2.

**Part:** 2 If n = 0 then the exponential Diophantine equation (13^2m) + (12γ + 1)^n = ρ^2 becomes (192m) + 1 = ρ^2, which is not solvable in whole numbers according to lemma 1.

**Part:** 3 If m, n are natural numbers, then (192m), (12γ + 1)^n are odd numbers.

⇒ (192m) + (12γ + 1)^n = ρ^2 is an even number
⇒ ρ is an even number
⇒ ρ^2 ≡ 0 (mod 3) or ρ^2 ≡ 1 (mod 3) (5)

Now 19 ≡ 1 (mod 3)
⇒ (192m) ≡ 1 (mod 3) and (12γ + 1) ≡ 1 (mod 3)
⇒ (192m) + (12γ + 1)^n ≡ 1 (mod 3)
⇒ (192m) + (12γ + 1)^n ≡ 2 (mod 3)
⇒ ρ^2 ≡ 2 (mod 3) (6)

The result of equation (6) denies the result of equation (5).

Hence the Diophantine equation (192m) + (12γ + 1)^n = ρ^2, where m, n are positive integers and γ, ρ are whole numbers, is not solvable in whole number.

**Part:** 4 If m, n = 0, then (192m) + (12γ + 1)^n = 1 + 1 = 2 = ρ^2, which is impossible because ρ is a whole number. Hence exponential Diophantine equation (192m) + (12γ + 1)^n = ρ^2, where m, n = 0 and γ, ρ are whole numbers, is not solvable in whole number.

### III. CONCLUSION

In this paper, authors successfully studied the exponential Diophantine equation (192m) + (12γ + 1)^n = ρ^2, where m, n, γ, ρ are whole numbers, for its solution in whole numbers. They determined that the exponential Diophantine equation (192m) + (12γ + 1)^n = ρ^2, where m, n, γ, ρ are whole numbers, is not solvable in whole number.
